Electrical Connections

⚠ WARNING

This water heater uses an external electrical source for power. It must be electrically grounded in accordance with all local codes or, in the absence of local codes, CSA C22.1 Canadian Electrical Code, in Canada, and/or the National Electrical Code, ANSI/NFPA 70, in the United States. Failure to properly ground this water heater can result in property damage, personal injury, or death.

This water heater must be connected on a separate fuse branch circuit. Check the water heater rating plate for the element wattage and voltage and make sure that the power supply wiring and the fusing or circuit breaker are the correct size for this water heater (see Table). Verify that all of the wire connections on the element and thermostat have been installed correctly, are secure, and that none of the wires are grounded, have split, or are broken (see diagram). If any of the original wiring needs replacing, use only 14AWG-type, or greater wire that is approved for 221°F (105°C).

To hook up the water heater to the power supply, connect the power supply wiring to the red and black wires attached to the top thermostat. **NEVER CONNECT THE POWER SUPPLY DIRECTLY ONTO THE THERMOSTAT.**

⚠ WARNING

The middle and lower elements may be “ON” simultaneously. In the event of failure, replace them with elements of the same **WATTAGE AND VOLTAGE** as specified on the rating plate of the water heater;

- 3,000 Watts for the middle element
- 800 Watts for the lower element

Table

Recommended wire and breaker				
Element Wattage	Recommended Wire Size*		Recommended Breaker Size	
	208 V	240 V	208 V	240 V
3,800 W	# 10	# 12	30A	20A
4,500 W	# 10	# 10	30A	30A

*Should conform to Local Codes.
The water heater must be grounded.
